Abstract

A concise summary of the paper: the problem addressed, the proposed approach, key results, and implications for the Gaussia framework.

1 Introduction

Motivate the problem. Why does AI evaluation need this metric or approach? What gap does it fill in the current Gaussia framework?

2 Related Work

Discuss existing approaches and how your proposal differs or improves upon them, citing prior work as needed [Author and Author, 2026].

3 Methodology

Describe your approach in detail. Include:

- Formal definitions and notation
- Mathematical formulations

3.1 Formal Definition

4 Implementation Considerations

Keep this section theoretical and SDK-agnostic. Describe what any implementation would need, not how a specific SDK should be structured (class hierarchies, APIs, and naming are decided per SDK):

- Inputs the approach consumes and the outputs it produces
- Semantics of the resulting score (range, interpretation, edge cases)
- Assumptions and limitations
- Computational complexity and other practical trade-offs

*Affiliation One

†Affiliation Two

5 Evaluation

If applicable, present experimental results:

- Datasets used
- Baselines compared against
- Results and analysis

6 Conclusion

Summarize contributions and outline future work.
